

WMT 'Elevator' Speech

- The Army's new Work Mapping Tool (WMT) is a component of the Enterprise Army Workload and Performance System (eAWPS), the Army's capstone suite of tools that will create a Total Army Data Environment, enabling leaders at all levels to use common data to fulfill their decision-making needs.
- As a part of eAWPS, Army leaders at all levels use WMT to retrieve budget data from the Resource Mapping Tool (RMT). WMT organizes budgetary data into work breakdown structures to manage projects, products, deliverables, services, and tasks.
- In addition, WMT links the work to the time-collection system creating a single thread from 1) budgeted work to 2) planned work, to 3) accomplished work to 4) cost of work. Time can be entered by civilian, military personnel, contractors, and foreign nationals so there is a full and complete account of all hours worked and tracked at the task level.
- WMT benefits the Warfighting Support Army by:
 - 1) Linking the budget and actual work to time collection so performance is measured;
 - 2) Providing a flexible interface allowing subordinate commands to further break down the workload;
 - 3) Allowing for re-organization at the individual position level without losing historical trends;
 - 4) Providing the necessary transparency to budgeting and time management metrics to key personnel enterprise-wide, thus allowing users to track historical performance against quantifiable metrics, providing a more accurate depiction of performance.
- WMT benefits the Warfighter by providing new data analysis capability required for continuous improvement in responsiveness, flexibility, and quality delivered by the Warfighting Support components.
